

Civica Cancer Pathways

Delivering excellence in cancer care pathway management

Almost three million people were referred for cancer checks over the last 12 months, the highest year on record. Up by over a tenth on the 2.4 million people referred before the pandemic.

The NHS 10 Year Cancer Plan places a focus on early diagnosis, treatment and personalised care for cancer patients. Civica Cancer Pathways offers a complete end-to-end clinical pathway for all aspects of cancer care and any other linked speciality.

It's the only solution in the UK to offer a regional shared care Cancer clinical management record. The collective data ensures that clinicians have the information to improve clinical care, patient outcomes and engagement. Patients can be tracked all the way from initial cancer referral through to follow-up support, including:

Patient tracking lists – for highlighting any potential breaches in waiting times and faster diagnosis standards.

Integration with diagnostic systems – allowing test results to be displayed in a single patient record.

Single queue diagnostics – for sharing regional diagnostic appointments in a central database to reduce waiting times.

Clinical and patient portals – for sharing test results, upcoming appointments, help and advice.

Personalised stratified follow-up tracking – to reduce the risk of missing early diagnosis of recurrent cancers.

Embedded MDT meeting management – supporting diagnosis and treatment plans.

Personalised care – providing treatment summaries and holistic needs assessments.

Key benefits:

- Delivers a single, shared patient database – saving significant time searching for information
- Displays a shared patient record between clinicians and patients – to improve communications and reduce un-necessary appointments
- Provides proven integration so any data entry duplication is avoided
- Shows real-time patient tracking lists so you can easily monitor and review cancer waiting times

- Fully future proof solution – easily adaptable to respond rapidly to dataset collection changes
- Scalable deployment model – ability to record specific focus for data or the entire cancer pathway.

Key takeaways

- 1 Clearer visibility to track and monitor patient pathways
- 2 Supporting early diagnosis and improved patient outcomes
- 3 Patient engagement and personalised care across cancer pathway.
