

CMyTrees

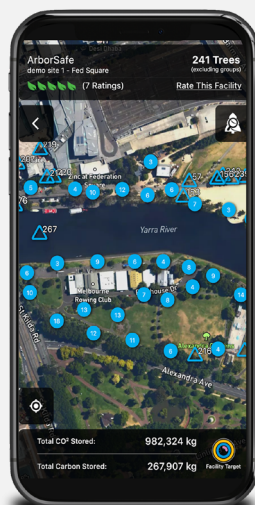

Show the world how your trees store carbon

CMyTrees is a free app from ArborSafe that calculates the carbon stored in trees on your site or at your home. You can also use the app to promote your green credentials and offset your carbon footprint.

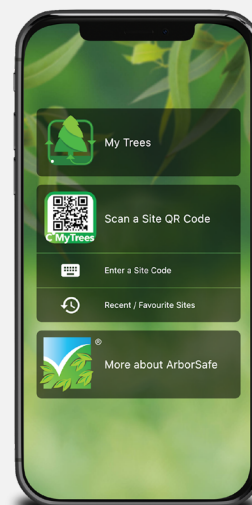

Set targets to offset your carbon footprint.

By adding your energy usage and a period you wish to offset, you can clearly see how your emissions compare with the carbon stored in your trees. This way, C My Trees helps you to move towards a zero-carbon footprint.

Calculate the carbon in your trees.

The app displays the carbon stored in each tree and the total carbon stored across your site, creating a real-time view of the enormous carbon storage your trees provide. You can add tree data yourself or use data from ArborSafe assessments.

Promote your green credentials..

With the free CMyTrees app, you can publish a QR code that links to your facility's live tree carbon data and targets. Facility users and other people can scan the code to clearly see how your site or your home is doing in the fight against climate change.

To get started, download the free **CMyTrees app** from the
