

Reflect is the industry-leading inspection and maintenance management solution, supporting local and state governments for over 20 years. We offer organisations innovative features and customisations to achieve sustainable asset service delivery.

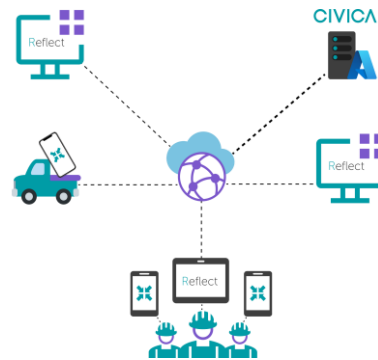

The versatile and user focused design provides easy and detailed maintenance activity recording and planning. Asset managers and maintenance planners can harness this data to analyse expenditure, programming and service delivery outcomes.

Personalised Software

The reflect software is fully configurable to meet the requirements of all organisations regardless of size. Our customers range from rural councils to state authorities which each have their own personalised solution – existing policies, procedures and WHS Workplace Health and Safety.

Secure Data Storage

Reflect takes the burden of storing data locally by sending all data to our cloud-based servers. Maintenance records, images and image metadata can be accessed anywhere using our web portal to deliver accurate and real time reporting.

Mobile Recording

Recording meaningful data is an important function to defining asset delivery needs. Reflect enables organisations to record maintenance activities through iOS and Android devices. GPS and chainage data are used in the field, to determine which assets are being serviced.

Service Delivery Outcomes

Reflect extracts data into business intelligence tools making decision making easy. Through our modules, you can forecast for maintenance expenditure, work programming and service delivery using historical data
